家庭生活日记账: 计价精确到"8分8厘3"

2012年11月09日 20:57:04

来源: 北京晚报

【纠错】

Journal of family life pricing accurate to 8 points 8% 3

2012 at 17:28 on November 9th Beijing Evening News

Google Translate translate.google.com

"婴儿纸尿裤,384元;手机贴膜,10元;报纸,1元……"十年来的每一天,在北京 这座城市,都有5000个收入不同、构成各异的家庭在细心填写着统一格式的生活账本—— 《城镇居民家庭生活情况日记账》。

这一行行的"针头线脑"真实记录着他们的生活轨迹,也勾勒着"城镇居民可支配收 "城镇住户调查收入情况"等事关国计民生的统计数据。

而长年和这些原生态数据打交道的基层调查员们,总能亲身感知到生活在这座城市中 的人们赚钱、花钱的那些事......

我们每天的生活如何变成数字,数字又如何影响我们的生活?

北京有5000个记账户家庭,他们的记录将成为政府了解居民收入、生活、物价等多方 面信息的渠道,为制订社会发展计划和进行科学决策提供重要依据,包括最低生活保障 线、最低工资标准等等。这些家庭由统计调查单位遵循随机抽样的原则选取,记账家庭三 年整体轮换一次。

他们填报的数据,经过系统的整理、汇总和分析后,每个月都会形成《城镇居民人均 可支配收入》等多份数据报告,公众可以进入北京统计信息网(www.bistats.gov.cn) 查 询。

"Baby diaper, 384 yuan; cell phone foil, 10 yuan; newspaper, 1 yuan ..." Every day in the past decade, in the city of Beijing, there are 5,000 different income, constitute a different family carefully fill in a unified format Living Book - "Journal of Urban Households Living Journal."

This line of "needle and thread" really records their life trajectory, but also outlines the "urban residents disposable income", "urban household survey income" and other statistics on people's livelihood.

For many years, grass-roots investigators who deal with these original ecological data can always personally know those people who live in the city make money and spend money ...

How do our daily lives become numbers, and how do numbers affect our lives?

Beijing has 5,000 households with book-keeping households. Their records will be the channels through which the government can understand various aspects of residents' incomes, living standards, prices and other information, and provide an important basis for formulating social development plans and making scientific decisions, including the minimum living standard and the minimum wage and many more. These families are selected by the statistical investigation unit following the principle of random sampling, and the bookkeeping households are rotated in their entirety in three years.

The data they fill in, after systematically arranging, aggregating and analyzing, each month will form a number of data reports such as "per capita disposable income of urban residents" and

Why is MT difficult?

Some examples

John loves Mary. Jean aime Marie.

John told Mary a story. *Jean a raconté une histoire à Marie.*

John is a computer scientist. Jean est informaticien.

John swam across the lake. Jean a traversé le lac à la nage.

Correspondences

```
John loves Mary.
Jean aime Marie.
John told
           Mary a story.
Jean [a raconté] une histoire [à Marie].
John is a [computer scientist].
Jean est informaticien.
John [swam across] the lake.
Jean [a traversé] le lac [à la nage].
```

Correspondences

One-to-one:

John = *Jean*, aime = *loves*, Mary=*Marie*

One-to-many/many-to-one:

Mary = [*à Marie*]
[a computer scientist] = informaticien

Many-to-many:

[swam across__] = [a traversé ___ à la nage]

Reordering required:

told Mary₁ [a story]₂ = a raconté [une histoire]₂ [à Marie]₁

6

Lexical divergences

The different senses of **homonymous words** generally have different translations:

English-German: (river) bank - Ufer

(financial) bank - Bank

The different senses of polysemous words may also have different translations:

I know that he bought the book: Je sais qu'il a acheté le livre.

I know Peter: Je connais Peter.

I know math: Je m'y connais en maths.

Lexical divergences

Lexical specificity

German *Kürbis* = English *pumpkin* or *(winter) squash* English *brother* = Chinese *gege* (older) or *didi* (younger)

Morphological divergences

English: **new** book(s), **new** story/stories

French: un **nouveau** *livre* (sg.m), une **nouvelle** histoire (sg.f), des **nouveaux** *livres* (pl.m), des **nouvelles** histoires (pl.f)

- How much inflection does a language have?
 (cf. Chinese vs.Finnish)
- -How many **morphemes** does each word have?
- -How easily can the morphemes be **separated**?

Syntactic divergences

Word order: fixed or free?

If fixed, which one? [SVO (Sbj-Verb-Obj), SOV, VSO,...]

Head-marking vs. dependent-marking

Dependent-marking (English) the man's house Head-marking (Hungarian) the man house-his

Pro-drop languages can omit pronouns:

Italian (with inflection): $I eat = mangi \mathbf{o}$; $he eats = mangi \mathbf{a}$ Chinese (without inflection): $I/he eat: ch\bar{\imath}f$

Syntactic divergences: negation

	Normal	Negated	
English	I drank coffee.	I didn't drink (any) coffee.	<i>do</i> -support, <i>any</i>
French	J'ai bu du café	Je n' ai pas bu de café.	nepas <i>du → de</i>
German	Ich habe Kaffee getrunken	Ich habe keinen Kaffee getrunken	keinen Kaffee = 'no coffee'

Semantic differences

Aspect:

- -English has a **progressive aspect**: 'Peter swims' vs. 'Peter is swimming'
- -German can only express this with **an adverb**: 'Peter schwimmt' vs. 'Peter schwimmt gerade' ('swims currently')

Motion events have two properties:

- -manner of motion (swimming)
- -direction of motion (across the lake)

Languages express either the manner with a verb and the direction with a 'satellite' or vice versa (L. Talmy):

English (satellite-framed): He [swam]MANNER [across]DIR the lake

French (verb-framed): *Il a [traversé] DIR le lac [à la nage]* MANNER

Machine translation approaches

The Rosetta Stone

Three different translations of the same text:

- -Hieroglyphic Egyptian (used by priests)
- -Demotic Egyptian (used for daily purposes)
- -Classical Greek (used by the administration)
 Instrumental in our understanding of ancient Egyptian

This is an instance of parallel text:

The Greek inscription allowed scholars to decipher the hieroglyphs

MT History

WW II: Code-breaking efforts at Bletchley Park, England (Alan Turing)

1948: Shannon/Weaver: Information theory

1949: Weaver's memorandum defines the task

1954: IBM/Georgetown demo: 60 sentences Russian-English

1960: Bar-Hillel: MT to difficult

1966: ALPAC report: human translation is far cheaper and better: kills MT for a long time

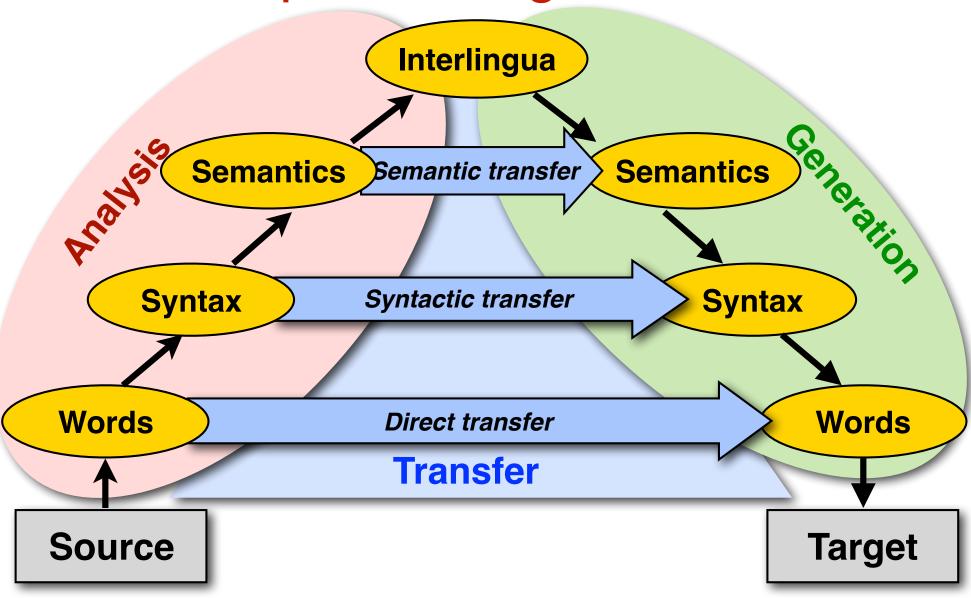

1980s/90s: Transfer and interlingua-based approaches

1990: IBM's CANDIDE system (first modern statistical MT system)

2000s: Huge interest and progress in wide-coverage statistical MT: phrase-based MT, syntax-based MT, open-source tools

Now: Neural machine translation

The Vauquois triangle

Direct translation

Maria non dió una bofetada a la bruja verde.

1. Morphological analysis of source string

Maria non_{Neg} dar_{3sgF-Past} una bofetada a la bruja verde (usually, a complete morphological analysis)

2. Lexical transfer (using a translation dictionary):

Mary not slap_{3sgF-Past} to the witch green.

3. Local reordering:

Mary not slap_{3sgF-Past} the green witch.

4. Morphology:

Mary did not slap the green witch.

Limits of direct translation: Phrasal reordering

Adverb placement in German:

The green witch is at home this week.

Diese Woche ist die grüne Hexe zuhause.

Japanese SOV order:

He adores listening to music

Kare ha ongaku wo kiku no ga daisuki desu

PPs in Chinese:

Jackie Cheng went to Hong Kong

Cheng Long dao Xianggang qu

Syntactic transfer

Requires a syntactic parse of the source language, followed by reordering of the tree

Local reordering:

Nonlocal reordering:

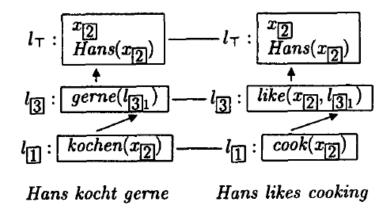

Semantic transfer

Done at the level of **predicate-argument structure** (some people call this syntactic transfer too...):

Hans likes cooking

or at the level of semantic representations (e.g. DRSs):

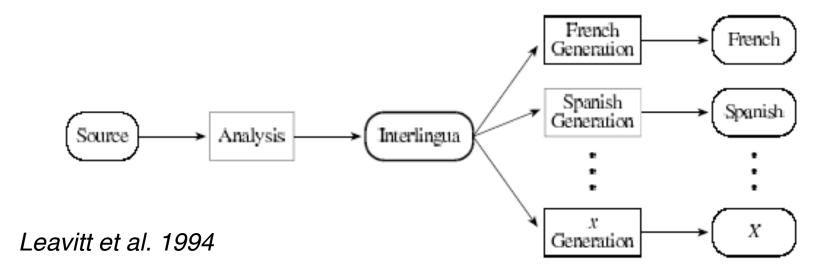

Dorna et al. 1998

Interlingua approaches

Based on the assumption that there is one **common meaning representation** (e.g. predicate logic) that abstracts away from *any* difference in surface realization.

Semantic transfer: each language produces its own meaning representation

Was thought useful for multilingual translation

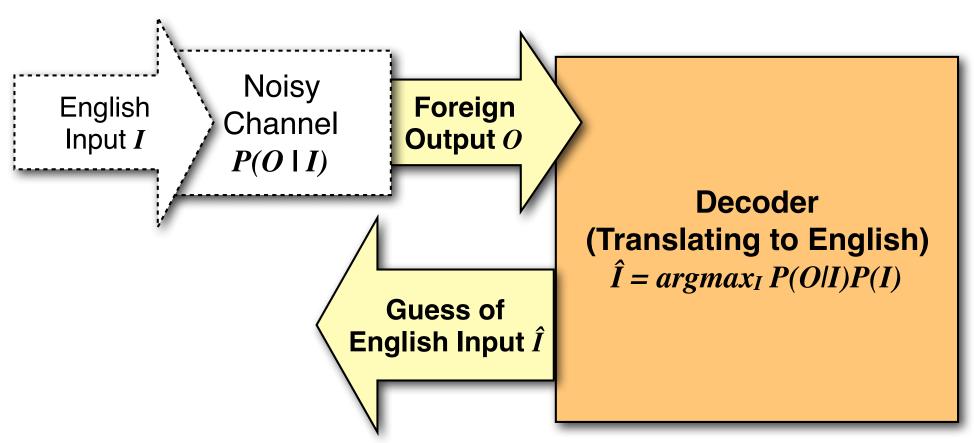

Statistical Machine Translation

The noisy channel model

Translating from Chinese to English:

$$\operatorname{argmax}_{Eng} P(Eng|Chin) = \operatorname{argmax}_{Eng} \underbrace{P(Chin|Eng)}_{\text{Translation Model}} \times \underbrace{P(Eng)}_{\text{LanguageModel}}$$

The noisy channel model

This is really just an application of **Bayes' rule**:

$$\begin{split} \hat{E} &= \arg\max_{E} P(E|F) \\ &= \arg\max_{E} \frac{P(F|E) \times P(E)}{P(F)} \\ &= \arg\max_{E} \underbrace{P(F|E) \times P(E)}_{\text{Translation Model Language Model}} \end{split}$$

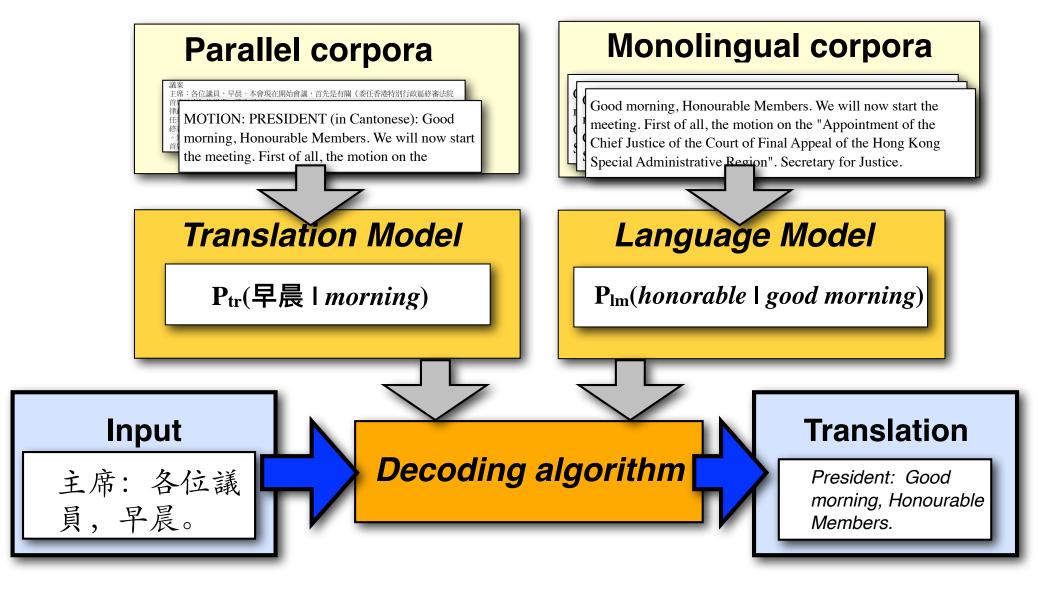

The translation model $P(F \mid E)$ is intended to capture the faithfulness of the translation.

It needs to be trained on a parallel corpus

The **language model** P(E) is intended to capture the **fluency of the translation**.

It can be trained on a (very large) monolingual corpus

Statistical MT

n-gram language models for MT

With training on data from the web and clever parallel processing (MapReduce/Bloom filters), *n* can be quite large

- -Google (2007) uses 5-grams to 7-grams,
- -This results in huge models, but the effect on translation quality levels off quickly:

Size of models

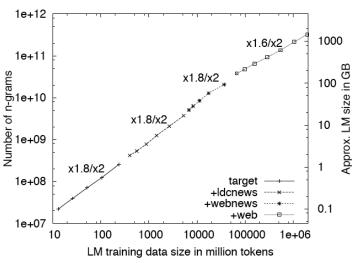

Figure 3: Number of n-grams (sum of unigrams to 5-grams) for varying amounts of training data.

Effect on translation quality

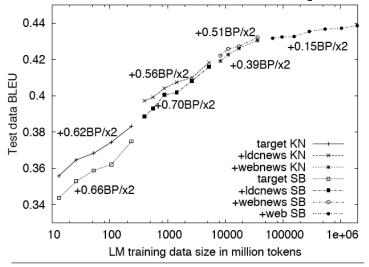

Figure 5: BLEU scores for varying amounts of data using Kneser-Ney (KN) and Stupid Backoff (SB).

Translation probability $P(fp_i | ep_i)$

Phrase translation probabilities can be obtained from a phrase table:

EP	FP	count
green witch	grüne Hexe	•••
at home	zuhause	10534
at home	daheim	9890
is	ist	598012
this week	diese Woche	

This requires phrase alignment on a parallel corpus.

Creating parallel corpora

A parallel corpus consists of the same text in two (or more) languages.

Examples: Parliamentary debates: Canadian Hansards; Hong Kong Hansards,

Europarl; Movie subtitles (OpenSubtitles)

In order to train translation models, we need to align the sentences (Church & Gale '93)

English	French		English	French
According to our survey, 1988 sales of mineral water and soft drinks were much higher than in 1987, reflecting the growing popularity of these products.
